

7. Project Documentation

Suggested final report content and evidence checklist

Abstract

This micro project demonstrates importing structured employee information from an Excel spreadsheet into ServiceNow using Import Sets and Transform Maps. Data is loaded into a staging table, mapped to a custom target table, and transformed. Coalesce is used to match existing employees during subsequent imports. Reports and a dashboard provide a view of employee records.

Introduction

Spreadsheet-based data exchange is a common way to provide bulk records. ServiceNow Import Sets provide a staging step, while Transform Maps define how source data is applied to target records. This project presents the workflow using sample employee data.

Problem Definition and Objectives

Describe the need to reduce manual entry for bulk employee data and to provide a repeatable import process. List the objectives from the Ideation section.

System Requirements and Design

Document platform/software prerequisites, table fields, staging table, Transform Map name and source/target tables, field mappings, Coalesce key, and reporting design.

Implementation Details

Include the nine development phases and explain the key configuration decisions: source workbook headers, target field types, Import Set staging, Transform Map mapping, transform execution, and Coalesce on Employee ID.

Testing and Results

Insert the executed test matrix and screenshots. Describe actual inserted, updated, and ignored/skipped counts from your own Transform History. The supplied project document gives an illustrative example but your final report should use your actual run results.

Reports and Dashboard

Describe Employees by Department (pie/count), Employees by Location (bar/count), and Employee List Report (five employee columns), then show the Employee Analytics Dashboards view.

Conclusion

Summarize what was configured and verified. Discuss how staging and field mapping support the import workflow and how Coalesce can help prevent duplicate employee records on repeated imports. Only claim successful outcomes that your test evidence demonstrates.

Future Enhancements

- Add validation for missing or malformed employee IDs and email values.

- Define a clear error-handling and remediation process for rejected rows.
- Use a controlled data dictionary and standard naming conventions.
- Explore scheduled imports or integration-based feeds if supported by project requirements.
- Add role-based access and data protection checks before using real employee information.

Documentation Checklist

- Cover page and project details.
- Abstract and introduction.
- Problem statement, objectives, and scope.
- Requirements and design diagrams.
- Stepwise implementation with screenshots.
- Executed test cases and actual results.
- Reports and dashboard evidence.
- Conclusion, future enhancements, and references.
