

5. Project Development Phase

Step-by-step implementation guide

Phase 1 — Prepare the Spreadsheet

- Open a new Google Spreadsheet or spreadsheet editor.
- Create employee sample data with columns Employee ID, Employee Name, Email, Department, and Location.
- Check that the first row contains headers and that each row represents one employee.
- Download or save the workbook in .xlsx format.

Phase 2 — Create the Custom Table

- Navigate to Tables → Create New in ServiceNow.
- Set Label to Employee Test and Name to u_employee_test.
- Save the table, open its form, and use Configure → Form Layout.
- Create Employee ID, Employee Name, Email, Department, and Location as String fields; add them and save the layout.
- Verify that the fields appear on the Employee Test form.

Phase 3 — Create the Import Set Table

- Open Load Data from the application navigator.
- Create an import table with Label Employee Import; the name is auto-populated (shown as u_employee_import in the project document).
- Submit and proceed to Create Transform Map.

Phase 4 — Create the Transform Map

- Choose Create Transform Map.
- Set Name to Sample Spreadsheet Import.
- Confirm Source Table is Employee Import and select Employee Test as Target Table.
- Use Auto Map Matching Fields, then Mapping Assist to review and map all five fields.
- Save the Transform Map and verify the mappings.

Phase 5 — Transform and Validate

- Run Transform from the import workflow and confirm the completion status.
- Open Employee Test from the application navigator.
- Review the imported rows and rearrange list columns if needed to display the five employee fields.
- Compare sample target records against the original spreadsheet.

Phase 6 — Enable Coalesce

- Open the created Transform Map and locate its Field Maps related list.

- Edit the Employee ID field map and set Coalesce to True (the document describes changing a field map from False to True).
- Save the map. Employee ID is now the matching key for the repeat-import exercise.

Phase 7 — Import Updated and New Rows

- Return to Load Data and select the existing Employee Import table.
- Choose the updated spreadsheet as the file; set Sheet number to 1 and Header row to 1, then submit.
- Run the existing transform map and inspect Transform History.
- The source document's example adds two new employee IDs and changes two existing employees' values; use equivalent controlled sample data for your own test.
- Verify that new IDs are inserted and matching IDs are updated. Reimport the same sheet to test that no further inserts or updates occur and rows are ignored/skipped as expected.

Phase 8 — Create Reports

- Create Employees by Department: Table = Employee Test; Pie chart; Group by Department; Aggregation = Count.
- Create Employees by Location: Table = Employee Test; Bar chart; Group by Location; Aggregation = Count.
- Create Employee List Report: Table = Employee Test; List type; include Employee ID, Employee Name, Email, Department, and Location.
- Run and save each report.

Phase 9 — Add Reports to Dashboard

- Create a dashboard named Employee Analytics Dashboards.
- Open each saved report, use its sharing/add-to-dashboard option, and add it to the created dashboard.
- Confirm that the department chart, location chart, and employee list are visible on the dashboard.
