

6. Project Testing

Test plan, cases, and result recording

Testing Objective

Verify that spreadsheet rows are staged, mapped, transformed, and represented correctly in the target table; check that Coalesce handles repeated employee IDs as intended; and confirm reports and dashboard display the target data.

Test Environment

ServiceNow instance with the project tables and Transform Map configured. Use a small controlled spreadsheet with synthetic employee records. Record the instance/release and test date in the final submission.

Test Cases

Use the following cases and fill in Actual Result and Pass/Fail after executing them.

Test Case Matrix

TC-01 — Valid spreadsheet load

Action: Load an .xlsx file into Employee Import with sheet 1 and header row 1. Expected: import completes and staging rows are available for transformation.

TC-02 — Field mapping

Action: Transform rows containing values in all five columns. Expected: Employee ID, Employee Name, Email, Department, and Location appear in their matching target fields.

TC-03 — New employee insert

Action: Import a row with an Employee ID not present in Employee Test. Expected: a new target record is created.

TC-04 — Existing employee update

Action: Import a row with an existing Employee ID and changed name/email. Expected: the matching target record is updated, not duplicated.

TC-05 — Repeat identical import

Action: Import the same data again after the initial update/insert test. Expected: no additional target records; record processing reflects no-change/ignored behavior according to the configured map.

TC-06 — Transform status review

Action: Open Transform History after each run. Expected: run status and row-level outcomes can be reviewed.

TC-07 — Report verification

Action: Run the department and location reports and the employee list report. Expected: reports use Employee Test and show grouped counts or configured columns.

TC-08 — Dashboard verification

Action: Open Employee Analytics Dashboards. Expected: all three reports are present and render.

Test Evidence to Capture

- Spreadsheet input used for each test.
- Transform completion message and Transform History.
- Employee Test list before and after reimport.
- Field Map Coalesce setting.
- Saved reports and dashboard view.

Result Recording Template

For each test case, record: Test ID | Execution date | Actual result | Status (Pass/Fail) | Evidence screenshot filename | Notes. Do not mark a test as passed until it has been run and verified.
