

2. Requirement Analysis

Functional, technical, and data requirements

Functional Requirements

- The system shall accept an Excel spreadsheet as an import source.
- The system shall stage incoming rows in an Import Set table.
- The system shall map source columns to target table fields using a Transform Map.
- The system shall insert new employee records and update existing records matched by the coalesce field.
- The system shall provide a way to inspect transformation results and validate target records.
- The system shall support reports grouped by department and location, plus a list report.

Non-Functional Requirements

- Data should remain consistent between source columns and target fields.
- The import process should be repeatable and understandable to a beginner.
- The workflow should provide visible success/error or transform-history information for validation.
- The sample project should be maintainable through clear field names and documented steps.

Software and Tools

- ServiceNow instance with permissions to create tables, import sets, transform maps, reports, and dashboards.
- Spreadsheet editor such as Google Sheets or Microsoft Excel.
- Excel workbook saved in .xlsx format.
- Web browser for ServiceNow access.

Data Specification

Source and target data fields: Employee ID, Employee Name, Email, Department, and Location. The spreadsheet should use a header row, with employee data in subsequent rows. The source document demonstrates loading sheet 1 with header row 1.

Target Table Design

Custom table label: Employee Test. Table name: u_employee_test. Create the five employee fields as String fields, matching the project document.

Import Set Design

Import Set table label: Employee Import. The table name may be auto-populated by ServiceNow (the supplied document shows u_employee_import). The table acts as a staging area before transformation.

Assumptions and Constraints

- A ServiceNow environment and suitable role permissions are available.
- The spreadsheet contains structured rows and consistent headers.

- The sample data is for demonstration and should not contain real personal employee data.
- Exact UI labels and navigation may vary by ServiceNow release and instance configuration.
